## **How To Install PHP Infusion much Faster**

Hi ya guys

I wanna to share my experience about how to install PHP Infusion much faster than original one.

The different about this tutorial just in you zip file that you want to upload and you must use Cpanel for extract it.

Ok let us begin

First of all you should get php Infusion file from

[http://www.php-fusion.co.uk/downloads.php?cat\\_id=3](http://www.php-fusion.co.uk/downloads.php?cat_id=3)

After that You extract file to your computer, go to folder php-files than in that folder rename blank\_config.php to config.php and rezip this folder, you can use zip or tar.gz.

Upload this file with your FTP client to your site in folder public\_html.

Go to Your Cpanel and after that go to you MySql and make MySql database and user (Do Not Forget the database name, user name, and password).

Back to Your Cpanel main menu select filemanager, after file manager open, please select file that you already upload, select it name, and after that chose extract from right menu on filemanager.

After It extrac, with your FTP client please change this file/folder CHMOD to 777

- administration/db\_backups/
- \* images/
- \* images/imagelist.js
- \* images/articles/
- \* images/avatars/
- \* images/news/
- \* images/news\_cats/
- \* images/photoalbum/
- \* images/photoalbum/submissions/
- \* forum/attachments/
- \* config.php

Go to your URI it would be something like this <http://www.your-domain.com/setup.php> and follow the instruction step by step, after that delete setup.php file with your ftp client, and change CHMOD config.php to 644.

And it all done
